

The Saint Barnabas Regional Craniofacial Center

is proud to offer a comprehensive service for infants who require an evaluation for *plagiocephaly* and *torticollis*.

Plagiocephaly:

A condition in which the infant's skull becomes flattened on one side more than the other due to uneven pressure or position.

Torticollis:

A condition where the neck muscles on one side are tight, causing restricted neck motion and tilted head position.

These two common conditions are often seen together in infants and both need to be identified and treated for complete resolution.

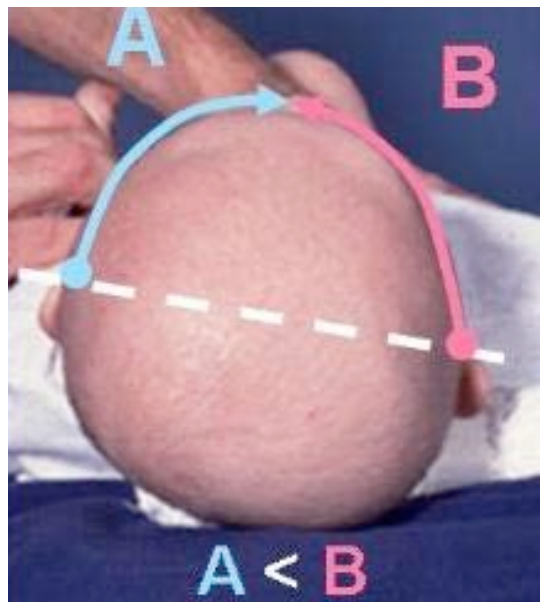

Conveniently located in the Pediatric Outpatient Rehab Center, our team will provide both a physical examination by our craniofacial surgeon as well as an evaluation by a pediatric physical therapist for possible associated muscle dysfunction.

At the conclusion of the evaluation each patient will receive a comprehensive plan of care. Follow up care and appointments will be arranged by the Craniofacial Center.

Please call us at 973.322.6363 to schedule an appointment or to make a referral.
